ABSTRACT

The forests of Western Ghats, are a treasure house for new and interesting fungi. Tropical forests produce a large amount of litter which is a favoured source of nutrient for fungal colonization. Fungi are the major degraders of plant litter which is basically composed of cellulose and lignin. Plant litter is divided into leaf litter, branch litter, bark litter, fruit litter, flower litter and seed litter. Litter fungi play a major role in carbon and nitrogen cycling in forest ecosystem. In an attempt to document the biodiversity of litter fungi of the region, litter samples were collected from different places in Goa and some parts of Karnataka, Kerala, Tamilnadu and Maharashtra. The fungi were isolated and cultured by direct isolation, moist chamber incubation and particle filtration methods. In all, 230 litter fungi belonging to 164 genera of hyphomycetes, ascomycetes and coelomycetes were isolated. These included several rare and interesting species in the monotypic genera like *Bibanasiella*, *Cheiromyceopsis*, *Esdipatilia*, *Gliophragma*, *Megacapitula*, *Morrisiella*, *Paradictyoarthrinium*, *Pseudogliophragma* and *Venustosynnema*. New species belonging to *Dendryphiopsis*, *Digitoramispora*, *Natarajania*, *Spondylocladiopsis*, *Stauriella*, *Tetraploa* and *Vamsapriya* have been recorded. The study further deals with the distribution of the fungi in the Western Ghats region of Goa.

Keywords: Litter fungi, Biodiversity, Distribution

INTRODUCTION

Western Ghats range, one of the mega biodiversity hotspots, is a treasure house for several new and interesting fungi (Bhat, 2010). Tropical forests produce a large amount of litter which is a favoured source of nutrient for fungal colonization. Generally, litter is divided into leaf litter, branch litter, bark litter, fruit litter, flower litter and seed litter. Fungi are the major degraders of plant litter which is composed of basically cellulose and lignin and play a major role in carbon and nitrogen cycling in forest ecosystem (Johanna, 2009).

Fungi play an important role in leaf litter decomposition due to their ability to break down the lignocellulose matrix, which other organisms are unable to digest.

Several studies have been made on the ecology of tropical forest litter fungi. Subramanian and Vittal (1979, 1980) studied the fungi colonizing litter of *Atlantia monophyla* and *Gymnosporia emarginata* from Madras. There have been a series of such studies of saprobic fungal succession on the plants pertaining to various ecosystems. Some examples are those of Manoharachary *et al.*, (1976) on *Cassia glauca*, Sudha (1978) on *Glycosmis* and *Ixora*, Mehrotra and Aneja (1979) on *Chenopodium album*, Vittal and Sukumaran (1981) on *Cymbopogon flexuosus*, Sankaran (1993) on *Paraserianthes falcataria*, *Eucalyptus tereticornis* and *Tectona grandis*, Tiwari *et al.*, (1994) on *Ananas comosus* and Srivastava *et al.*, (1998) on *Saccharum officinarum*). Miriam and Bhat (2000) isolated 54 fungi, while studying the diversity and abundance of microfungi on decaying leaf litter of *Ficus benghalensis*. Ramesh and Chalannavar (2000) studied the fungal colonization of *Achras sapota* and *Swietenia mahagoni* leaf litter and recorded 18 species of fungi belonging to 16 genera from Achras sapota and 17 species belonging to 15 genera from *Swietenia mahagoni*. Shanthi and Vittal (2010) studied the diversity of microfungi associated with litter of *Pavetta indica* from Tambaram, Chennai, India, and recorded 54 fungal species belonging to 40 genera.

MATERIALS AND METHODS

Sampling

Collection trips were conducted to several places in Goa and some parts of Karnataka, Kerala, Tamilnadu and Maharashtra and different fungal substrates were gathered from diverse habitats. The samples were brought to the laboratory in plastic bags and subjected to direct, moist chamber incubation, single spore and particle plating isolation methods (Bhat, 2010).

Isolation of Fungi

The samples were examined for associated fungi. Some of the specimens which did not show sporulating structures were subjected to moist chamber incubation so as to enable the fungi to grow and sporulate (Hawksworth, 1974). Single spores or fungal spore masses were picked up with the help of sterilized needle under a stereoscope and the fungi were cultured (Wang and Wen, 1997). The litter samples were also subjected to particle plating method (Bills and Polishook, 1994). The litter was thoroughly washed under running tap water followed by sterile distill water and ground into fine particles. The pulverized sample was filtered through two superimposed metal sieves of mesh size of 250 and 100 µm. The particles trapped in the lower sieve, those between 100 and 250 µm size were washed repeatedly with sterile distilled water and plated on 2% potato

dextrose agar or any suitable medium with antibiotics. The plates were incubated at 22–25°C. Colonies originating from each particle were individually and aseptically transferred to fresh plate.

Characterization and Identification of Fungi

Fungi with sporulating structures were observed under a compound microscope for detailed diagnostic features which aided in their identification. Sporulating structures such as conidiophores and conidia in case of hyphomycetes, pycnidia, conidiogenous cells and conidia in case of coelomycetes and ascocarp, asci and ascospores in ascomycetes were considered as diagnostic features in the identification of fungi. Using appropriate references (Carmichael *et al.*, 1980; Ellis, 1971, 1976; Matsushima 1975), the isolates were identified and assigned to respective genera and species. Illustrations of fungi with all morphological details were made under different magnifications using a camera lucida drawing tube and photomicrographs were taken using an Olympus DP12 digital camera fitted to an Olympus BX41 microscope.

RESULTS

A total of 470 taxa assignable to 230 fungi were recovered from different litter samples collected from 18 places in Goa, 3 localities in Karnataka, 2 in Kerala, 2 in Tamilnadu and 2 in Maharashtra. A total of 164 genera were recovered of which 136 fungi were identified up to species level. The remaining remained as undetermined taxa. This study yielded the isolation of several novel taxa which included one new genus (*Natarajania*) and 7 new species (*Dendryphiopsis goanensis* (Pratibha *et al.*, 2010), *Digitoramispora tambdisurlensis* (Pratibha *et al.*, 2009), *Natarajania indica* (Pratibha and Bhat, 2005), *Spondylocladiopsis aseptata* (Pratibha *et al.*, 2009), *Stauriella indica* (Pratibha *et al.*, 2010), *Tetraploa circinata* (Pratibha and Bhat, 2008) and *Vamsapriya mahabaleshwarensis* (Pratibha and Bhat, 2008), (Table 1, Figs. 1-7). Six species of the monotypic genera, viz. *Bibasakiella*, *Cheiromyceopsis*, *Esdipatilia*, *Gliophragma*, *Megacapitula*, *Morrisiella*, *Paradictyoarthrinium*, *Pseudogliophragma* and *Venustosynnema* were isolated during the course of the study (Table 2, Figs. 8-16). Some rare and interesting fungi such as *Bahusandhika indica*, *Cancellidium appланatum*, *Costantinella palmicola*, *Cryptophialoidea secunda*, *Dicranidion fragile*, *Dictyoarthrinium sacchari*, *Gangliostilbe indica*, *Gangliostilbe malabarica*, *Hyphodiscosia jaipurensis*, *Kostermansinda magna*, *Moorella speciosa*, *Phialosporastilbe setosa*, *Physalidiella elegans*, *Piricaudiopsis elegans*, *Polyscytalum fecundissimum*, *Sadasivania girisa*, *Shrungabeeja vadirajensis* and *Spegazzinia deightonii* were isolated (Table 3, Figs. 17-35). Besides many common litter fungi were also recovered (Table 4, Figs. 36-65).

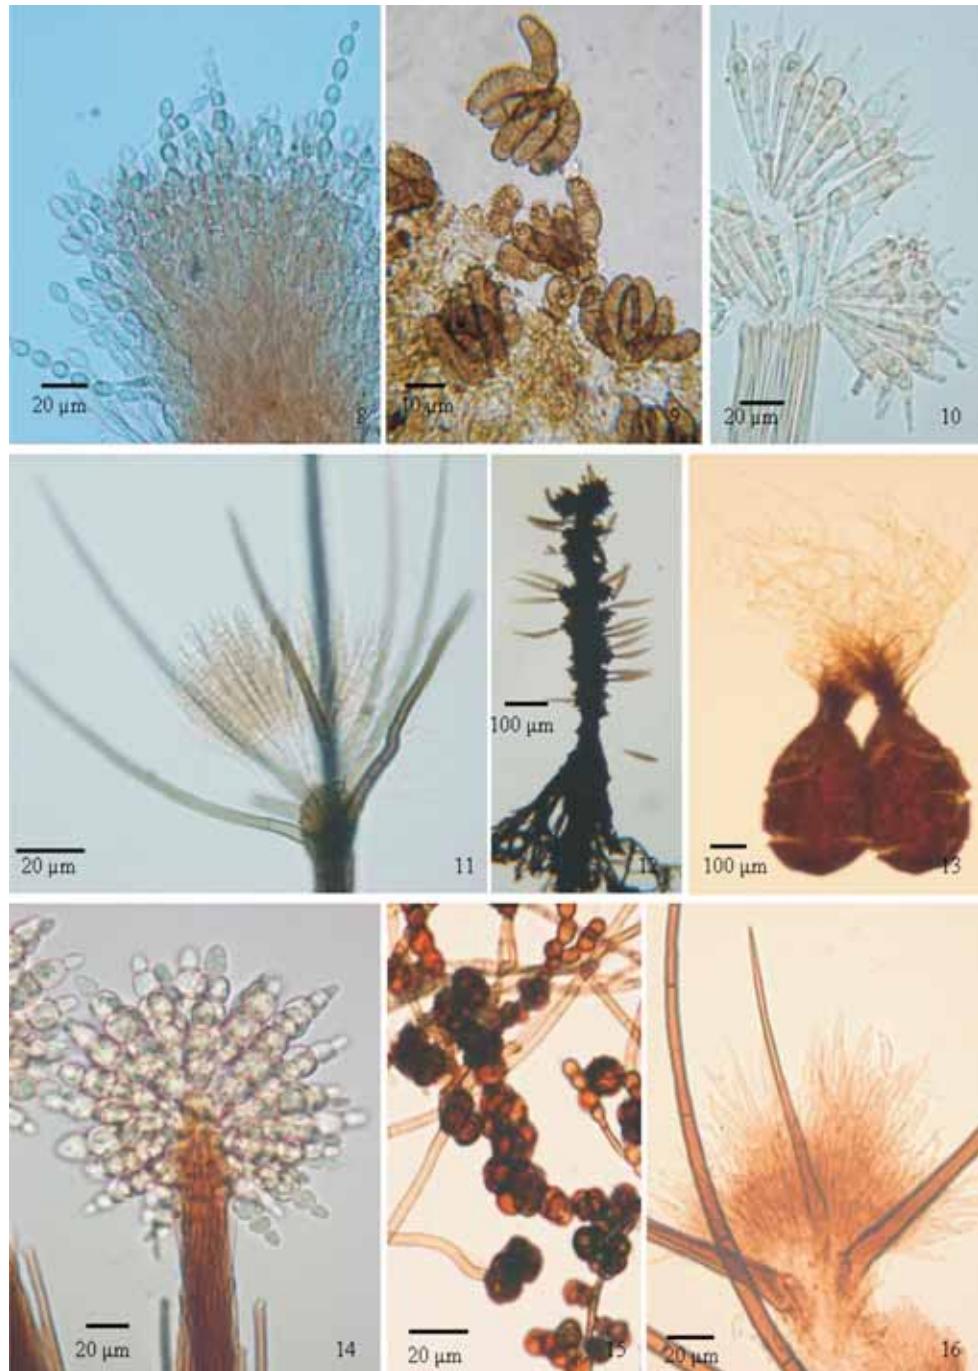

Fig. 2: Species from monotypic genera: 8. *Bibanasiella ramispora*, 9. *Cheiromyciopsis verrucosa*, 10. *Esdipatilia indica*, 11. *Gliophragma setosum*, 12. *Morrisiella indica*, 13. *Megacapitula villosa*, 14. *Paradictyoarthrinium diffractum*, 15. *Pseudogliophragma indica*, 16. *Venustosynnema ciliata*

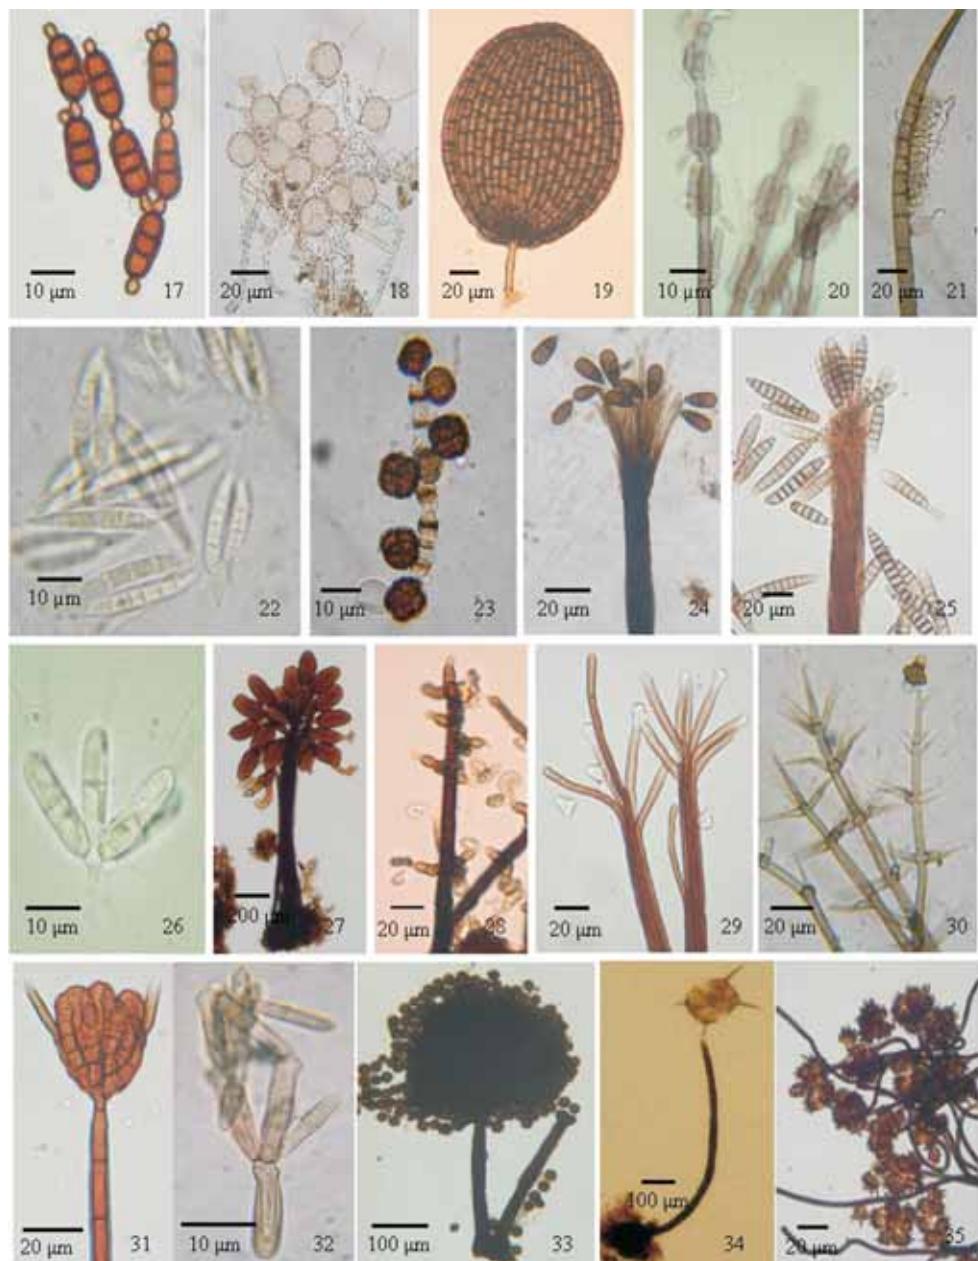

Fig. 3: Rare and interesting fungi: 17. *Bahusandhika indica*, 18. *Brachiosphaera tropicalis*, 19. *Cancellidium applanatum*, 20. *Costantinella palmicola*, 21. *Cryptophialoidea secunda*, 22. *Dicranidion fragile*, 23. *Dictyoarthrinium sacchari*, 24. *Gangliostilbe indica*, 25. *Gangliostilbe malabarica*, 26. *Hyphodiscosia jaipurensis*, 27. *Kostermansinda magna*, 28. *Moorella speciosa*, 29. *Phialosporastilbe setosa*, 30. *Physalidiella elegans*, 31. *Piricaudiopsis elegans*, 32. *Polyscytalum fecundissimum*, 33. *Sadasivania girisa*, 34. *Shrungabeeja vadirajensis*, 35. *Spegazzinia deightonii*

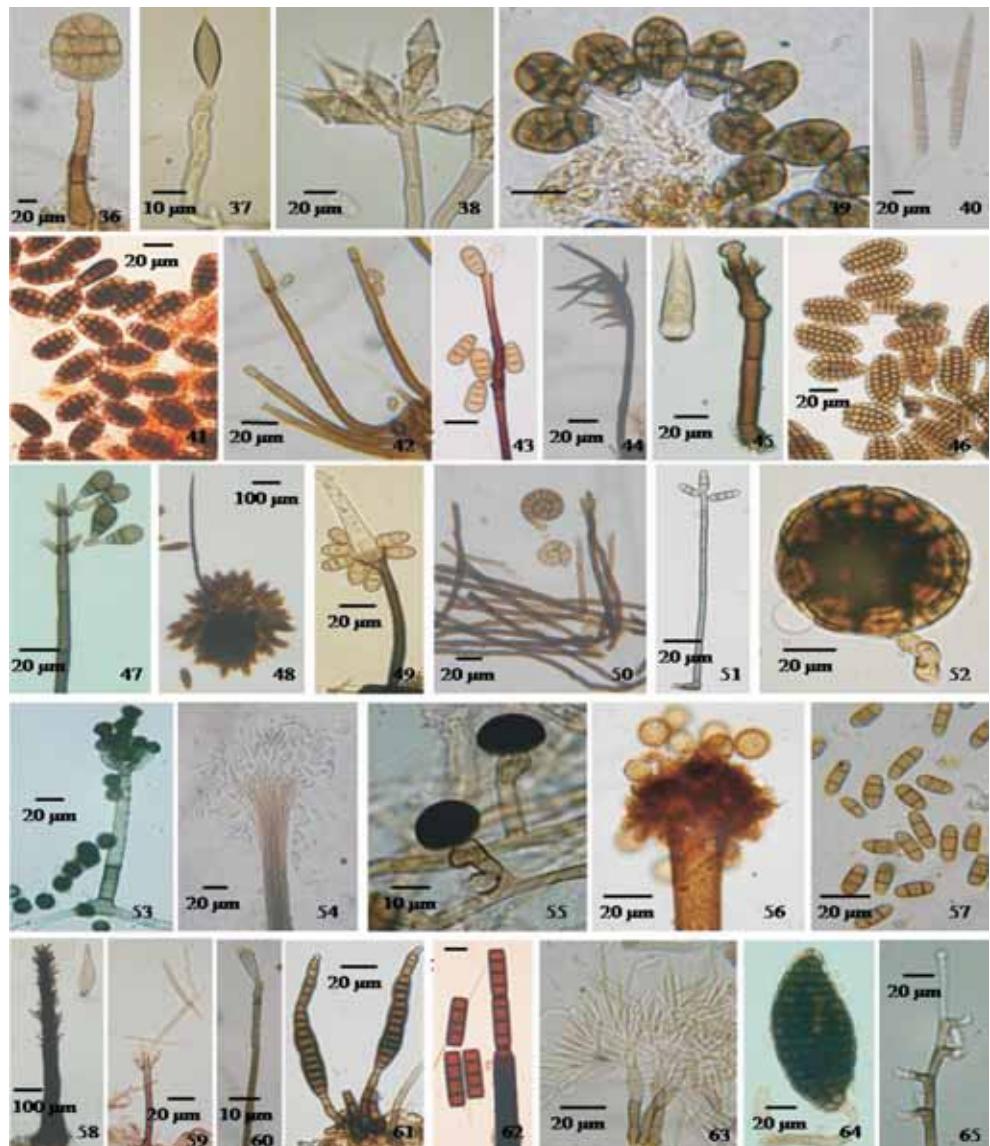

Fig. 4: Commonly isolated litter fungi: 36. *Acrodictys globulosa*, 37. *Ardhachandra crystaspora*, 38. *Beltrania rhombic*, 39. *Berkleasmium typhae*, 40. *Camposporium* sp., 41. *Canalisporium caribens*, 42. *Catenularia myriocarpa*, 43. *Cordana* sp., 44. *Cryptophiale apicalis*, 45. *Deightoniella torulosa*, 46. *Dictyosporium elegans*, 47. *Edmundmasonia pulchra*, 48. *Excipularia narsapurensis*, 49. *Exerticlava vasiformis*, 50. *Helicoma* sp., 51. *Helminthosporium* sp., 52. *Hermatomyces tucumanensis*, 53. *Memnoniella* sp., 54. *Menisporopsis pleiosetosa*, 55. *Nigrospora sphaerica*, 56. *Periconia byssoides*, 57. *Pithomyces* sp., 58. *Podosporium rigidum*, 59. *Speiropsis simplex*, 60. *Sporidesmiella claviformis*, 61. *Sporidesmium* sp., 62. *Sporoschisma mirabile*, 63. *Subramaniomyces* sp., 64. *Xenosporium ovatum*, 65. *Zygosporium masonii*

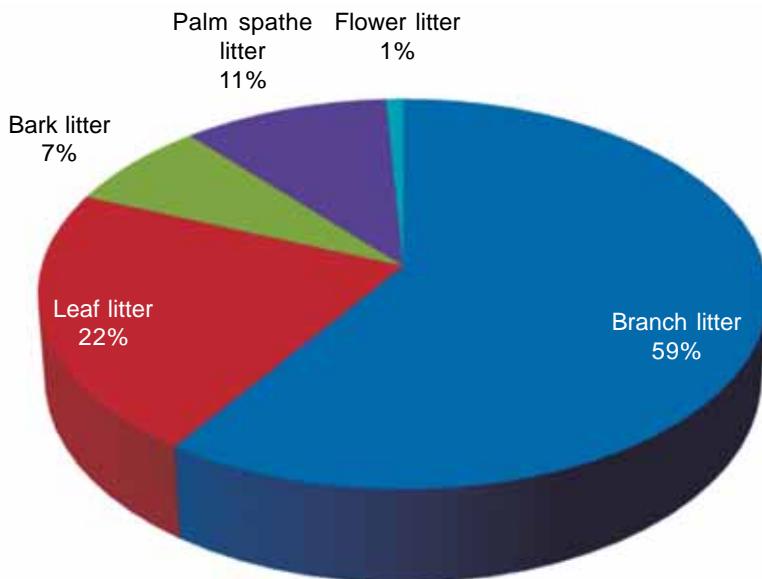

Fig. 5: Number of fungi (percent) isolated from different substrates

ACKNOWLEDGEMENTS

The UGC, New Delhi, is thanked for a DRS level special assistance support to the Department of Botany, Goa University. The CSIR, New Delhi, is thanked for a project grant during the tenure of which this worked was carried out.
